Mariam Oke
Intro to Web Dev
Due: 9/23/19

   After looking at the resources I noticed that I could use a top navigation and sub navigation menu for my global nav, where I'll include links to the About, Work, and Contact pages. When doing the box model exercises, for one of answers I wrote out:
"border-style: solid;
Border-color:navy;
Border-width: 25px;"
The output was correct but after looking at the answer I saw that I could've just wrote "border:25px solid navy;" and the output would have been the same. Some things that I found easy were using color and setting widths. I learned that negative numbers could be used for positioning. And the z-index can be used for positioning elements in front or behind each other. I could use this when putting text on top of images on my site. I had some trouble figuring out when positioning elements and figuring out when to use "postion:absolute" or "position:relative" but after looking at W3 schools I gained more clarity on that.
